PRINCIPLES OF MODERN CHEMISTRY has dominated the honors and high mainstream general chem-

istry courses and is considered the standard for the course. The fifth edition is a substantial revision that maintains the rigor of previous editions but reflects the exciting modern developments taking place in chemistry today. Authors David W. Oxtoby and H. P. Gillis provide a unique approach to learning chemical principles that emphasizes the total scientific process from observation to application placing general chemistry into a complete perspective for serious-minded science and engineering students. Chemical principles are illustrated by the use of modern materials, comparable to equipment found in the scientific industry. Students are therefore exposed to chemistry and its applications beyond the classroom. This text is perfect for those instructors who are looking for a more advanced general chemistry textbook.

As rapid advances in biotechnology occur, there is a need for a pedagogical tool to aid current students and laboratory professionals in biotechnological methods; **Methods in Biotechnology** is an invaluable resource for those students and professionals. **Methods in Biotechnology** engages the reader by implementing an active learning approach, provided advanced study questions, as well as pre- and post-lab questions for each lab protocol. These self-directed study sections encourage the reader to not just perform experiments but to engage with the material on a higher level, utilizing critical thinking and troubleshooting skills. This text is broken into three sections based on level - **Methods in Biotechnology**, **Advanced Methods in Biotechnology I**, and **Advanced Methods in Biotechnology II**. Each section contains 14-22 lab exercises, with instructor notes in appendices as well as an answer guide as a part of the book companion site. This text will be an excellent resource for both students and laboratory professionals in the biotechnology field.

This book teaches chemistry at an appropriate level of rigor while removing the confusion and insecurity that impair student success. Students are frequently intimidated by prep chem; Bishop's text shows them how to break the material down and master it. The flexible order of topics allows unit conversions to be covered either early in the course (as is traditionally done) or later, allowing for a much earlier than usual description of elements, compounds, and chemical reactions. The text and superb illustrations provide a solid conceptual framework and address misconceptions. The book helps students to develop strategies for working problems in a series of logical steps. The Examples and Exercises give plenty of confidence-building practice; the end-of-chapter problems test the student's mastery. The system of objectives tells the students exactly what they must learn in each chapter and where to find it.

Make the Grade offers comprehensive exam support for AS and A2 Chemistry. Part of the Nelson Advanced Science series it provides activities and questions for use throughout the course, with exam questions, including synoptic questions, to help students fully prepare for examinations.

Containing illustrations, worked examples, graphs and tables, this book deals with periodic precipitation (also known as Liesegang Ring formation) in terms of mathematical models and their logical consequences, and is entirely concerned with microcomputer analysis and software development. Three distinctive periodic precipitation mechanisms are included: binary diffusion-reaction; solubility modulation, and competitive particle growth. The book provides didactic illustrations of a valuable investigational procedure, in the form of hypothetical experimentation by microcomputer. The development of appropriate software is described and the resulting programs are available separately on disk. The software (for IBM compatible microcomputers; 5 1/4 and 3 1/2 inch disks available) will be sold separately by, The Carnation Press, PO Box 101, State College, PA 16804, USA.

Chemistry: Inorganic Qualitative Analysis in the Laboratory is a textbook dealing with qualitative analysis in the laboratory, as well as with the process of anion and cation analysis. The book presents an overview of the subject of inorganic qualitative analysis, including as the equipment, reagents, and procedures that are going to be used in the laboratory. Preliminary experiments include the classification of precipitates, handling precipitates, separation techniques, flame tests, Brown ring test, solvent extraction. The text also describes in detail how to prepare the experiment for anion and cation analysis such as testing for water solubility in a solid sample or the sodium carbonate treatment of a water-soluble sample. The book also explains the qualitative analysis for anions in preliminary and specific tests. In the qualitative analysis for cations, the student follows different procedures for Cation Groups I, II, III, IV or V. For example, the ions of Cation Group V cannot be precipitated by any Cation Groups I-IV reagents, nor by any single group reagent. The textbook is suitable for both chemistry teachers and freshmen students.
