Once you have your new form, it will be treated just like a class. You will be able to call it in your parent form. We will add a new button in our parent form that we will use to launch the child form. Select a button from the toolbox in your parent form's design editor and drag it on the form itself. The Solution Explorer window lists the names of all the forms that make up your Visual Basic .NET program, such as a form named frmMain.vb. After you know the name of the form that you want to display, you need to use BASIC command to open the form, such as the following: Dim oForm As FormName oForm = New FormName() oForm.Show() oForm = Nothing By using forms and the many controls and objects that you can add to them, you can make data entry on your worksheets easier and improve the way your worksheets look. You can also do this yourself with little or no need for Microsoft Visual Basic for Applications (VBA) code. A worksheet form is not the same thing as an Excel template.

#### Create a Windows Forms app in Visual Studio with Visual ...

Visual Basic Form is the container for all the controls that make up the user interface. Every window you see in a running visual basic application is a form, thus the terms form and window describe the same entity. Visual Studio creates a default form for you when you create a Windows Forms Application.
