BJUHRI - HUANG NICHOLSON

This volume provides a timely and useful introduction to the theory and practical application of image analysis in histology. This powerful research technique can be used to detect not only stored products in a cell (immunocytochemistry) but the synthetic machinery and the genes that control it (in situ hybridisation), as well as the specific binding sites that act as receptors for a molecule following its release (in vitro autoradiography). The book provides a good introduction for beginners before looking in greater detail at more advanced material in selected areas. The volume highlights the importance of technique in gathering quantitative information. The book is divided into four sections: introductory material, image acquisition, image processing, and applications. The applications areas include quantitative immunochemistry, quantification of nerves and neurotransmitters and automated grain counting in situ hybridisation histochemistry.

Kissing Architecture explores the mutual attraction between architecture and other forms of contemporary art. In this fresh, insightful, and beautifully illustrated book, renowned architectural critic and scholar Sylvia Lavin develops the concept of "kissing" to describe the grow-

ing intimacy between architecture and new types of art--particularly multimedia installations that take place in and on the surfaces of buildings--and to capture the sensual charge that is being designed and built into architectural surfaces and interior spaces today. Initiating readers into the guilty pleasures of architecture that abandons the narrow focus on function, Lavin looks at recent work by Pipilotti Rist, Doug Aitken, the firm Diller Scofidio + Renfro, and others who choose instead to embrace the viewer in powerful affects and visual and sensory atmospheres. Kissing Architecture is the first book in a cutting-edge new series of short, focused arguments written by leading critics, historians, theorists, and practitioners from the world of urban development and contemporary architecture and design. These books are intended to spark vigorous debate. They stake out the positions that will help shape the architecture and urbanism of tomorrow. Addressing one of the most spectacular and significant developments in the current cultural scene, Kissing Architecture is an entertainingly irreverent and disarmingly incisive book that offers an entirely new way of seeing--and experiencing--architecture in the age after representation.

For more than a decade, Americanists

have been concerned with the problem of ideology, and have undertaken a broad reassessment of American literature and culture. This volume brings together some of the best work in this area.

This sumptuously illustrated volume analyzes artists' representations of angels and demons and heaven and hell from the Judeo-Christian tradition and describes how these artistic portrayals evolved over time. As with other books in the Guide to Imagery series, the goal of this volume is to help contemporary art enthusiasts decode the symbolic meanings in the great masterworks of Western Art. The first chapter traces the development of images of the Creation and the Afterworld from descriptions of them in the Scriptures through their evolution in later literary and philosophical works. The following two chapters examine artists' depictions of the two paths that humans may take, the path of evil or the path of salvation, and the punishments or rewards found on each. A chapter on the Judgment Day and the end of the world explores portrayals of the mysterious worlds between life and death and in the afterlife. Finally, the author looks at images of angelic and demonic beings themselves and how they came to be portrayed with the physical attributes--wings, halos, horns, and cloven hooves--with which we are now so familiar. Thoroughly researched by and expert in the field of iconography, *Angels and Demons in Art* will delight readers with an interest in art or religious symbolism.

Despite persistent pressure from state censors and other tools of political control, investigative journalism has flourished in China over the last decade. This volume offers a comprehensive, first-

hand look at investigative journalism in China, including insider accounts from reporters behind some of China's top stories in recent years. While many outsiders hold on to the stereotype of Chinese journalists as docile, subservient Party hacks, a number of brave Chinese reporters have exposed corruption and official misconduct with striking ingenuity and often at considerable personal sacrifice. Subjects have included officials pilfering state funds, directors of public charities pocketing private donations, businesses fleecing unsuspecting consumers - even the misdeeds of journalists themselves. These case studies address critical issues of commercialization of the media, the development of ethical journalism practices, the rising specter of "news blackmail," negotiating China's mystifying bureaucracy, the dangers of libel suits, and how political pressures impact different stories. During fellowships at the Journalism & Media Studies Centre of the University of Hong Kong, these narratives and other background materials were fact-checked and edited by JMSC staff to address critical issues related to the media transitions currently under way in the PRC. This engaging narrative gives readers a vivid sense of how journalism is practiced in China. --David Bandurski is a scholar at the University of Hong Kong's China Media Project, a research and fellowship initiative of the Journalism & Media Studies Centre. Martin Hala has taught journalism at the Universities in Prague and Bratislava. - Currently, individuals interested in seeking an in-depth discussion of transplantation immunology must seek individual articles published in several journals, or extrapolate information from various non-transplant immunology textbooks. The purpose of this text is to provide the reader with a single source of informa-

tion for the basic science of immunobiology of organ transplantation. It is unique that it focuses on immunobiology from the basic research side, with an emphasis on the cellular and molecular levels. The readers will be physicians, scientists, and graduate students interested and engaged in the study of immunology as it relates to allo- and xenotransplantation. This book is designed to be the reference standard for the immunobiology of transplantation.

This book offers clinical oncologists an introduction to some selected topics of tumor biology where important progress has been made during the last decade. The concept is rather unique because it combines advances in clinical pathology, genetics, molecular oncology and immunology. The first two chapters deal with the genetic and molecular basis of malignant transformation on cellular level: DNA damage, mutations and repair mechanisms, oncogenes and tumor suppressor genes. The growth of a tumor cell population depends not only on cell division, but also on deregulation of apoptosis (chapter 3). Most clinical tumors are characterised by heterogeneity caused by different degrees of differentiation in different cell clones as illustrated for soft tissue tumors in chapter 4. The following chapters explain the multistep process of local tumor progression in gastro-intestinal cancers and malignant melanoma. Cellular and molecular aspects of metastases are dealt with in chapter 7. But host cells react to tumor cells and specific T-cell defined antigens offer a perspective for cancer vaccine development as reviewed in the last chapter. The book is timely because new diagnostic and therapeutic applications based on molecular oncology will reach the clinic at ever increasing pace.

19 jurisdictional chapters by leading professionals, featured chapters include contributions on United Nations best practice, the European directives, how countries are fighting corruption in the field and how PPP projects are procured. Legal advisers, government officers, consultants and academics will find the book useful in providing practical ideas regarding how best practices have been implemented in different jurisdictions and the results of such implementation.

Inelastic Analysis of Solids and Structures presents in a unified manner the physical and theoretical background of inelastic material models and computational methods, and illustrates the behavior of the models in typical engineering conditions. The book describes experimental observations and principles of mechanics, and efficient computational algorithms for stress calculations as typically performed in finite element analysis. The theoretical background is given to an extent necessary to describe the commonly employed material models in metal isotropic and orthotropic plasticity, thermoplasticity and viscoplasticity, and the plasticity of geological materials. The computational algorithms are developed in a unified manner with some detailed derivations of the algorithmic relations. Many solved examples are presented, which are designed to give insight into the material behavior in various engineering conditions, and to demonstrate the application of the computational algorithms.

Welcome to 1M 2003, the eighth in a series of the premier international technical conference in this field. As IT management has become mission critical to the economies of the developed world, our technical program has grown in relevance, strength and quality. Over the next few years, leading IT organizations

will gradually move from identifying infrastructure problems to providing business services via automated, intelligent management systems. To be successful, these future management systems must provide global scalability, for instance, to support Grid computing and large numbers of pervasive devices. In Grid environments, organizations can pool desktops and servers, dynamically creating a virtual environment with huge processing power, and new management challenges. As the number, type, and criticality of devices connected to the Internet grows, new innovative solutions are required to address this unprecedented scale and management complexity. The growing penetration of technologies, such as WLANs, introduces new management challenges, particularly for performance and security. Management systems must also support the management of business processes and their supporting technology infrastructure as integrated entities. They will need to significantly reduce the amount of adventitious, bootless data thrown at consoles, delivering instead a cogent view of the system state, while leaving the handling of lower level events to self-managed, multifarious systems and devices. There is a new emphasis on "autonomic" computing, building systems that can perform routine tasks without administrator intervention and take prescient actions to rapidly recover from potential software or hardware failures.

Development, deployment, and evaluation of interactive technologies for individuals with autism have been rapidly increasing over the last decade. There is great promise for the use of these types of technologies to enrich interventions, facilitate communication, and support data collection. Emerging technologies in

this area also have the potential to enhance assessment and diagnosis of individuals with autism, to understand the nature of autism, and to help researchers conduct basic and applied research. This book provides an in-depth review of the historical and state-of-the-art use of technology by and for individuals with autism. The intention is to give readers a comprehensive background in order to understand what has been done and what promises and challenges lie ahead. By providing a classification scheme and general review, this book can also help technology designers and researchers better understand what technologies have been successful, what problems remain open, and where innovations can further address challenges and opportunities for individuals with autism and the variety of stakeholders connected to them.
